## MODE D'EMPLOI

Before each use, you must freeze the eutectic liquid contained in the plate until it is solid completely. For this, put the eutectic plate for at least 24 hours in a freezer whether the temperature should be at least 6°C below the temperature of the eutectic mixture indicated on the colored cap.

To get a good performance, the eutectic liquid must be completely solid before use.

Because of the conception of the plate, we advice to freeze the plate in an horizontal position, if possible, in order to get an homogeneous repartition of the liquid in all the volume of the plate. In that way, the mechanical pressure made by the solidification of the liquid will be homogeneous in all the plate but also the optimization of the heat exchange over your products to cool.

Do not expose eutectic plates to extreme temperatures above + 50 °C or above -45 °C.

Once frozen, the eutectic plates are sensitive to shocks.
